

*Better Buildings Residential Network
Peer Exchange Call Series*

*People Matter: Latest Insights on How to Design Effective
Energy Efficiency and Carbon Reduction Programs*

August 11, 2022

Agenda and Ground Rules

- Agenda Review and Ground Rules
- Opening Poll
- Residential Network Overview and Upcoming Call Schedule
- Featured Speakers
 - **Beth Karlin**, See Change Institute
 - **Inês Azevedo**, Stanford University
 - **Reuven Sussman**, American Council for an Energy-Efficient Economy
- Open Discussion
- Closing Poll and Announcements

Ground Rules:

1. **Sales of services and commercial messages are not appropriate** during Peer Exchange Calls.
2. Calls are a safe place for discussion; **please do not attribute information to individuals** on the call.

The views expressed by speakers are their own, and do not reflect those of the Dept. of Energy.

Join the Network

Member Benefits:

- Recognition in media, social media and publications
- Speaking opportunities
- Updates on latest trends
- Voluntary member initiatives
- One-on-One brainstorming conversations

Commitment:

- Members only need to provide *one number*: their organization's number of residential energy upgrades per year, or equivalent.

Upcoming Calls (2nd & 4th Thursdays):

- *09/08: Insulation Update – Carbon, Hemp, Health and Air Sealing Advances*
- *09/22: Ups and Downs in Energy Markets: How Do Market Fluctuations and Uncertainties Affect Residential Efficiency Investments?"*
- *10/13: How to find DOE Funding for Residential Energy Efficiency*

Peer Exchange Call summaries are posted on the Better Buildings [website](#) a few weeks after the call

People Matter:

Insights on How to Design Effective
Energy Efficiency and Carbon Reduction

Dr. Beth Karlin

bkarlin@seechangeinstitute.com

We specialize in
**Research, Strategy,
Design, and Evaluation**
of environmental and
health behavior change.

But first...

Why behavioral science?

Why behavioral science?

So how can behavioral science help?

Clear research questions

What's the Alternative?

HOW Is Feedback Effective?

- 100+ studies conducted since 1976
- Total n = 256,536 (mean 119/study)
- Mean r-effect size = .1174 ($p < .001$)
- Average energy savings: 9%

Significant variability in effects
(from **negative** to **over 20%** savings)

HOW Is Feedback Effective?

Moderators identified in meta-analysis:

WHO?

Study population

HOW LONG?

Study duration

HOW OFTEN?

Frequency of feedback

WHAT TYPE?

Feedback medium

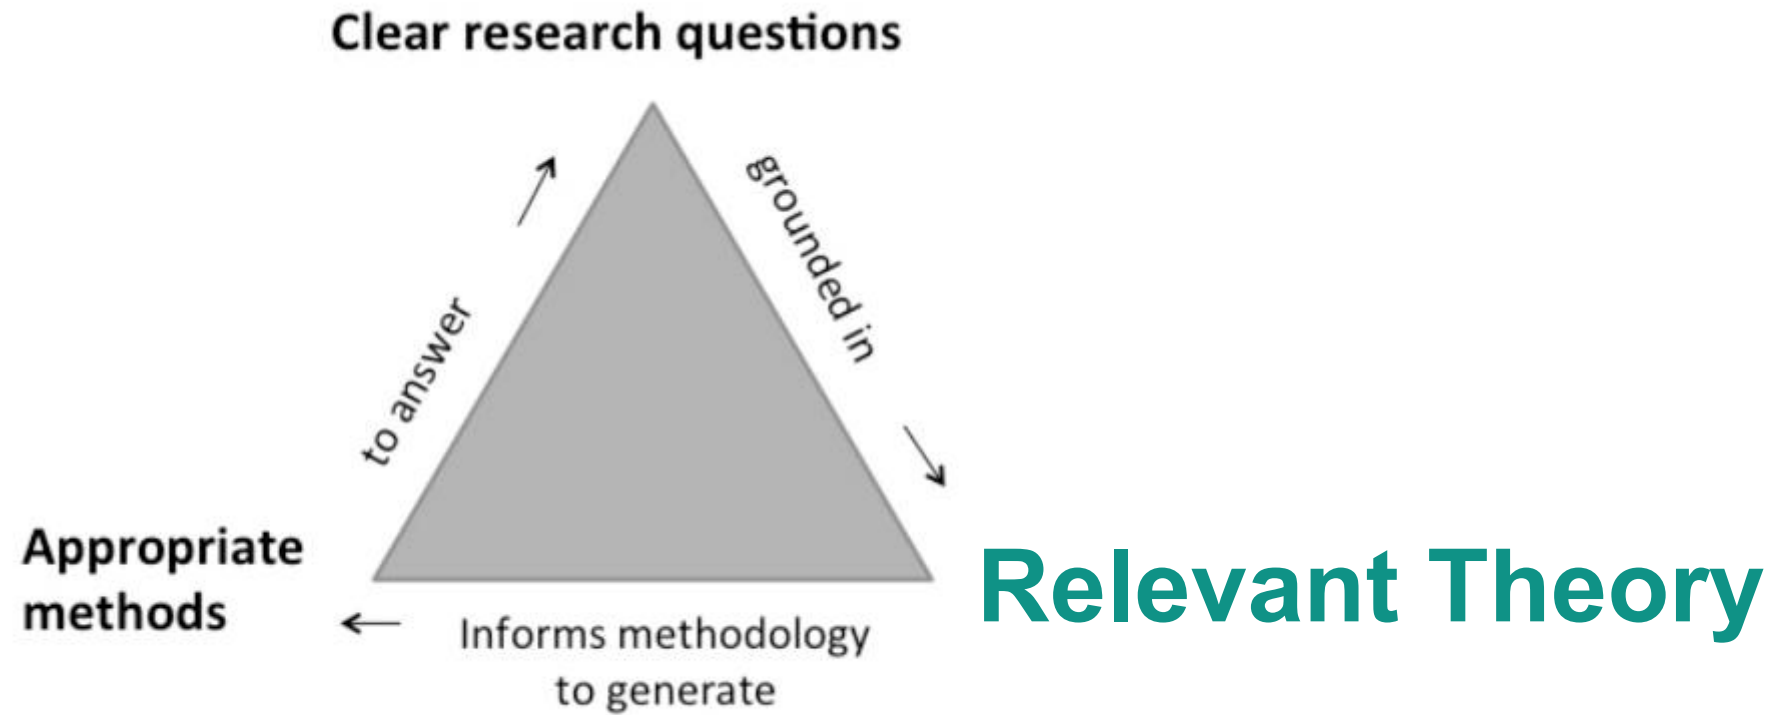

WHAT LEVEL?

Disaggregation

WHAT MESSAGE?

Comparison

Common Strategies

Information

Motivation

Connect the dots.

7

Miller, 1956

Connect the dots.

Connect the dots.

Show that it matters.

Behavioral Efficacy

Can I do it?

Response Efficacy

Will it matter?

Show that it matters

Just one person, eating one plant based meal a day for a year, will save almost 200,000 gallons of water and the equivalent of carbon in driving from Los Angeles to New York City.

- Suzy Amis Cameron

#EatForThePlanet

Make no decision the best decision.

Johnson & Goldstein, 2003

Make no decision the best decision.

**THE 100% RENEWABLE ENERGY DEFAULT IS
ONE OF THE EASIEST, MOST COST-EFFECTIVE,
IMMEDIATE, AND SIGNIFICANT WAYS FOR
COMMUNITIES TO ACT ON CLIMATE
AND REDUCE EMISSIONS**

Lighting maintenance

Make sure that bulbs, fixtures, lamps, and reflective surfaces are **cleaned regularly**.

By removing dust and grease, you can **increase the output** of your lights. Without maintenance, light levels can fall by more than 50% in 2-3 years.

A basic maintenance program can reduce lighting electricity costs **by up to 15%**.

Webinar theme: “What Are Best Practices in Behavior Change for
Energy Efficiency & Carbon Reduction”

Inês M.L. Azevedo

Associate Professor, Department of Energy Resources Engineering

Co-director, Bits & Watts Initiative Stanford

Senior Fellow, Woods Institute for the Environment

Senior Fellow, Precourt Energy Institute

Stanford University

<https://ines.stanford.edu>

Key messages

1. People are not very good at assessing their energy consumption or carbon footprint.
2. Feedback on information may not be enough to change behavior.
3. Rebound effects may exist but they are likely small.
4. Providing information on co-benefits may help with better decision making.
5. To understand the impacts of emissions we may need very geographical and temporally specific emissions data.

Key messages

1. People are not very good at assessing their energy consumption or carbon footprint.
2. Feedback on information may not be enough to change behavior.
3. Rebound effects may exist but they are likely small.
4. Providing information on co-benefits may help with better decision making.
5. To understand the impacts of emissions we may need very geographical and temporally specific emissions data.

Experiment with households to understand perceptions of energy use versus actual energy use.

Strategies for reducing residential energy consumption that encourage efficient energy use may rely on informed investment and operational decisions by households.

These strategies may be ineffective if consumers are unaware of how much electricity is used by different devices in their homes and buildings.

We compared consumers' perceptions of their appliances' electricity use to these appliances' **actual circuit level direct-metered electricity consumption** using an online survey.

118 homeowners from Austin, Texas were asked to estimate the energy consumption of six household devices during an average summer month.

Participants **overestimated the energy consumed by their low energy consuming devices and slightly underestimated that of their most energy-consuming device.**

Key messages

1. People are not very good at assessing their energy consumption or carbon footprint.
2. Feedback on information may not be enough to change behavior.
3. Rebound effects may exist but they are likely small.
4. Providing information on co-benefits may help with better decision making.
5. To understand the impacts of emissions we may need very geographical and temporally specific emissions data.

Will these energy saving be achieved?

Every so often the debate on “rebound effects” re-emerges...

The Opinion Pages | OP-ED CONTRIBUTORS

The Problem With Energy Efficiency

By MICHAEL SHELLINGER and TED NORDHAUS OCT. 8, 2014

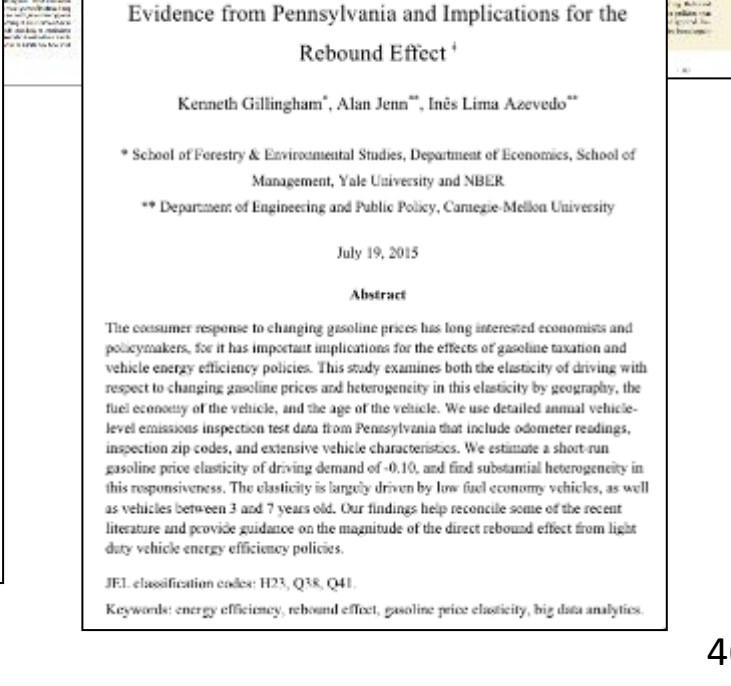

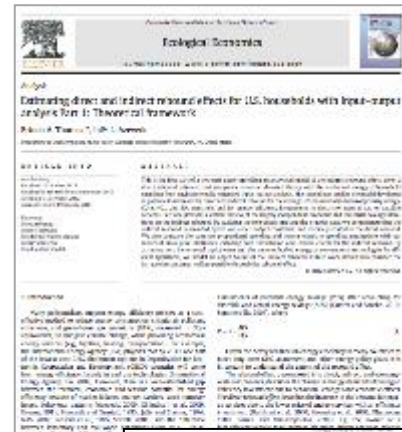

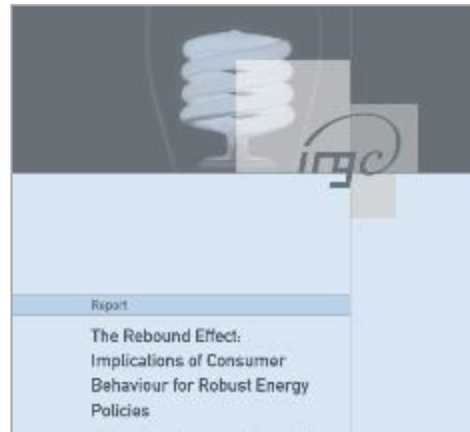

OAKLAND, Calif. — ON Tuesday, the Royal Swedish Academy of Sciences awarded the 2014 Nobel Prize in Physics to three researchers whose work contributed to the development of a radically more efficient form of lighting known as light-emitting diodes, or LEDs.

In announcing the award, the academy said, “Replacing light bulbs and fluorescent tubes with LEDs will lead to a drastic reduction of electricity requirements for lighting.” The president of the Institute of Physics noted: “With 20 percent of the world’s electricity used for lighting, it’s been calculated that optimal use of LED lighting could reduce this to 4 percent.”

The winners, Shuji Nakamura, an American, and Isamu Akasaki and Hiroshi Amano, both from Japan, justly

We have been working on several aspects of this “rebound effects” problem over the course of the last couple of years, and setting up a coherent research agenda:

Combining micro-econ with LCA

Average Household Carbon Footprint, 2004

Rebound in Emissions & Net Emissions Savings from Electric End-Use Efficiency, 2004 (ton CO₂e/year)

Rebound in Emissions & Net Emissions Savings from Electric End-Use Efficiency, 2004 (ton CO₂e/year)

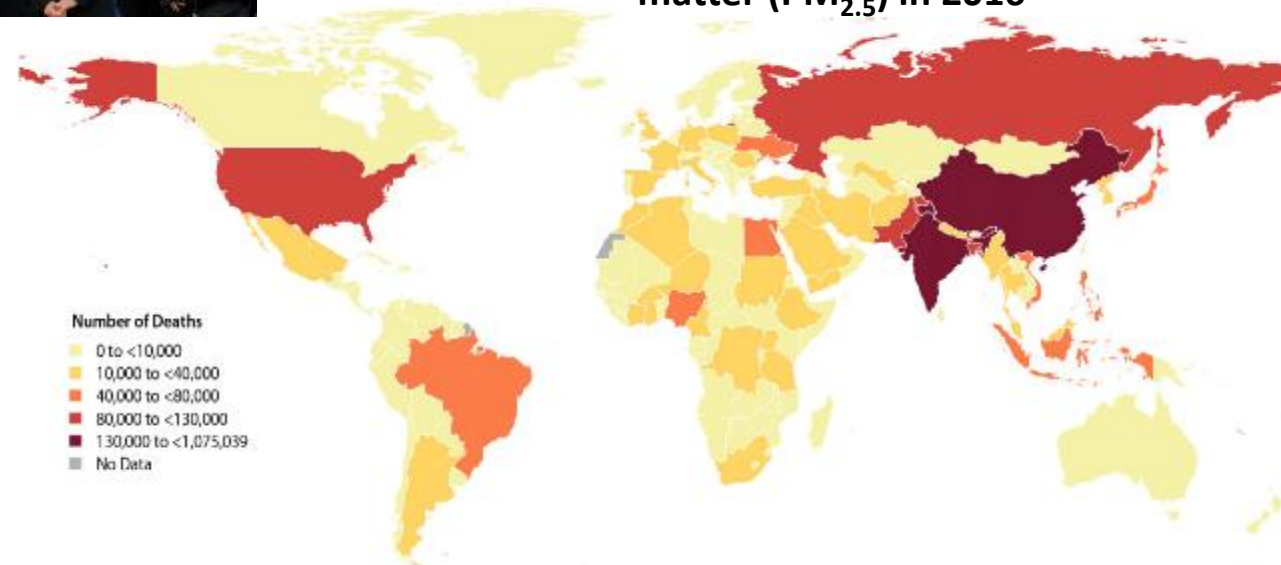

Key messages

1. People are not very good at assessing their energy consumption or carbon footprint.
2. Feedback on information may not be enough to change behavior.
3. Rebound effects may exist but they are likely small.
4. Providing information on co-benefits may help with better decision making.
5. To understand the impacts of emissions we may need very geographical and temporally specific emissions data.

Electricity services are responsible for greenhouse gas emissions and substantial air quality and health impacts

Deaths attributable to fine particulate matter (PM_{2.5}) in 2016

Questions

How do U.S. individuals value **tradeoffs** across climate change, air quality, and the cost of electricity?

How does providing information related to **climate** or **health** affect respondents' preferences?

Individuals respond to many comparisons of discrete electricity “futures” with up to four different attributes

Which of these scenarios would you prefer for your state?

(These are hypothetical scenarios...click here to learn more)

	Scenario 1	Scenario 2
Electricity portfolio Learn more	<p>Efficiency 1% Renewables 12% Nuclear 20% Natural gas 56% Coal 11%</p>	<p>Efficiency 1% Renewables 12% Nuclear 20% Natural gas 26% Coal 41%</p>
Climate change related emissions Learn more	<p>-100% 0% +100% +30% 30% increase in CO₂ from today</p>	<p>-100% 0% +100% -30% 30% decrease in CO₂ from today</p>
Health related air pollution Learn more	<p>-100% 0% +100% -30% 30% decrease in SO₂ from today</p>	<p>-100% 0% +100% +30% 30% increase in SO₂ from today</p>
Monthly electricity bill Learn more	<p>10% increase from current bill</p>	<p>10% decrease from current bill</p>
Which option do you choose?	<input type="radio"/>	<input type="radio"/>

Which of these scenarios would you prefer for your state?
 (These are hypothetical scenarios...click here to learn more)

	Scenario 1	Scenario 2
Electricity portfolio Learn more		
Climate change related emissions Learn more		
Health related air pollution Learn more		
Monthly electricity bill Learn more	10% increase from current bill	10% decrease from current bill
Which option do you choose?	<input type="radio"/>	<input type="radio"/>

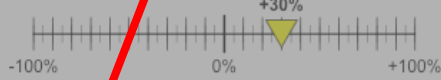

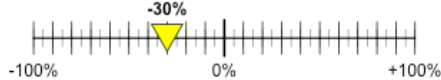

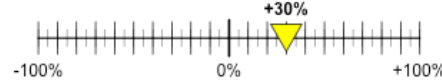

Electricity portfolio – ways of meeting a state's generation needs.

Which of these scenarios would you prefer for your state?
(These are hypothetical scenarios...click here to learn more)

	Scenario 1	Scenario 2
Electricity portfolio Learn more	Efficiency 1% Renewables 12% Nuclear 20% Natural gas 56% Coal 11%	Efficiency 1% Renewables 12% Nuclear 20% Natural gas 26% Coal 41%
Climate change related emissions Learn more	 30% increase in CO ₂ from today	 30% decrease in CO ₂ from today
Health related air pollution Learn more	 30% decrease	 30% increase
Monthly electricity bill Learn more	10% increase from current bill	10% decrease from current bill
Which option do you choose?	<input type="radio"/>	<input type="radio"/>

Climate change related emissions – change in annual CO₂ emissions from baseline i.e. current emissions levels (as percentages).

Which of these scenarios would you prefer for your state?
 (These are hypothetical scenarios...click here to learn more)

	Scenario 1	Scenario 2
Electricity portfolio Learn more	Efficiency 10% Renewables 20% Nuclear 20% Natural gas 56% Coal 11%	Nuclear 20% Natural gas 26% Coal 41%
Climate change related emissions Learn more	 30% increase in CO ₂ from today	 30% decrease in CO ₂ from today
Health related air pollution Learn more	 30% decrease in SO ₂ from today	 30% increase in SO ₂ from today
Monthly electricity bill Learn more	10% increase from current bill	10% decrease from current bill
Which option do you choose?	<input type="radio"/>	<input type="radio"/>

Health related air pollution – change in annual SO₂ emissions from baseline i.e. current emissions levels (as percentages).

Which of these scenarios would you prefer for your state?

(These are hypothetical scenarios...click here to learn more)

	Scenario 1	Scenario 2
Electricity portfolio		
Climate change related emissions		
Health related air pollution		
Monthly electricity bill	10% increase from current bill	10% decrease from current bill
Which option do you choose?	<input type="radio"/>	<input type="radio"/>

Respondents indicate their preference by choosing **one** of the two alternatives

Experimental design for evaluating the effect of climate and health information

Randomized controlled trial with different emissions attributes shown in the task.

Respondents assigned to one of four groups, where they see...

	Portfolio	Bill	CO ₂	SO ₂
Group 1: No info on emissions	✓	✓		
Group 2: CO₂ only	✓	✓	✓	
Group 3: SO₂ only	✓	✓		✓
Group 4: Info on both	✓	✓	✓	✓

When emissions information is shown, people show more support for renewables, *even* if that entails a 20% increase in electricity bills

When emissions information is shown, people show more support for renewables, *even* if that entails a 20% increase in electricity bills

When information on emissions reductions is shown, people show more support for renewables, *even* if that entails a 20% increase in electricity bills

When information on emissions reductions is shown, people show more support for renewables, *even* if that entails a 20% increase in electricity bills

When information on emissions reductions is shown, people show more support for renewables, *even* if that entails a 20% increase in electricity bills

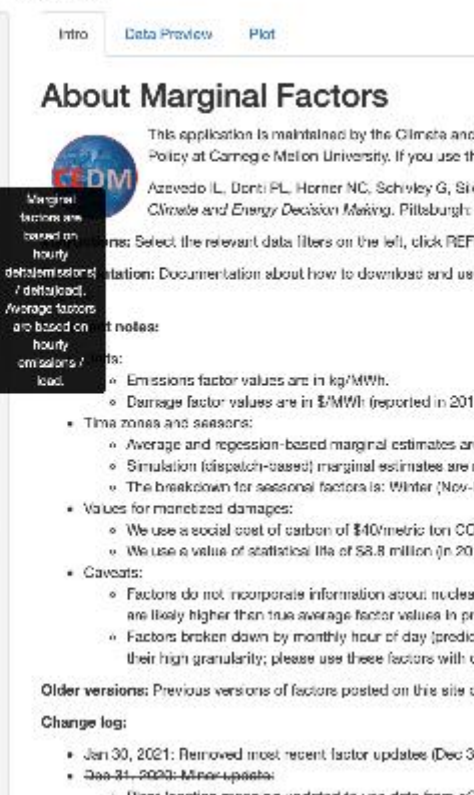

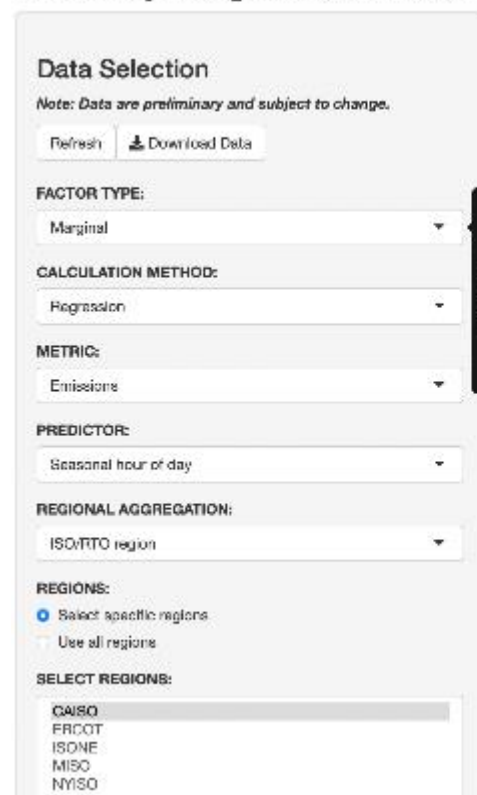

Key messages

1. People are not very good at assessing their energy consumption or carbon footprint.
2. Feedback on information may not be enough to change behavior.
3. Rebound effects may exist but they are likely small.
4. Providing information on co-benefits may help with better decision making.
5. To understand the impacts of emissions we may need very geographical and temporally specific emissions data.

We have developed such tools.

Better Buildings Peer Exchange Webinar – August 11, 2022

Surprised by your energy bill?

What we wanted to learn

Do renters choose more efficient rental units when listings contain energy efficiency information?

Which labels are most effective?

Which renters value energy efficiency the most?

The Experiment

- Simulate rental listing search results
- Control rental listing attributes
- Display efficiency information in different ways
 - Control group – no information
- Ask renters to pick their preferred homes
- Calculate
 - Likelihood of clicking on efficient listings
 - Willingness to raise rental price for efficiency

Where do you want to live?

Do renters choose more efficient rental units when listings contain energy efficiency information?

Yes! Energy Information Affects Decisions!

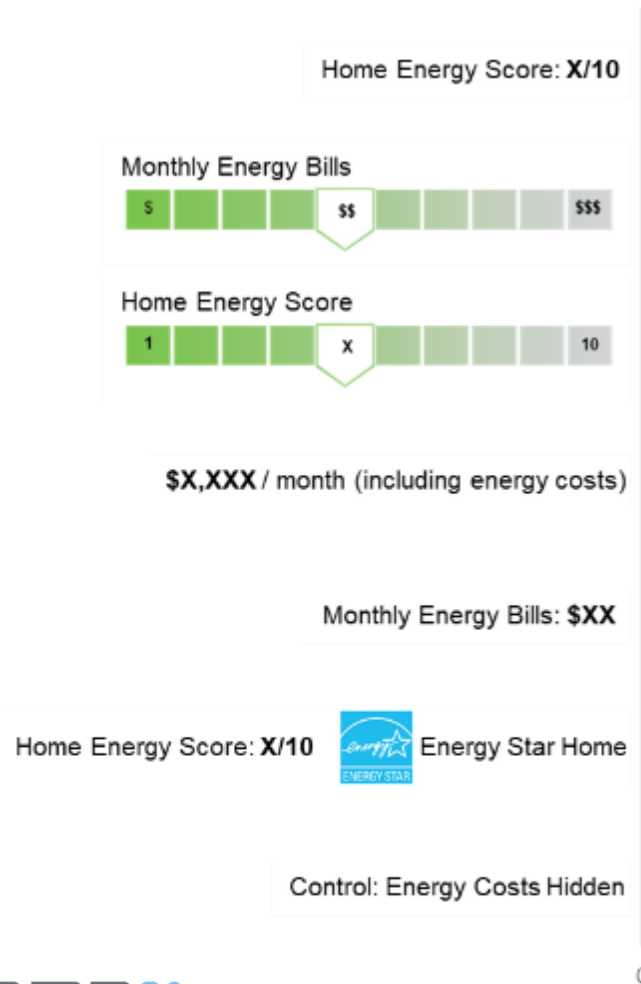

Which labels are most effective?

Choosing the most efficient option

Choosing the least efficient option

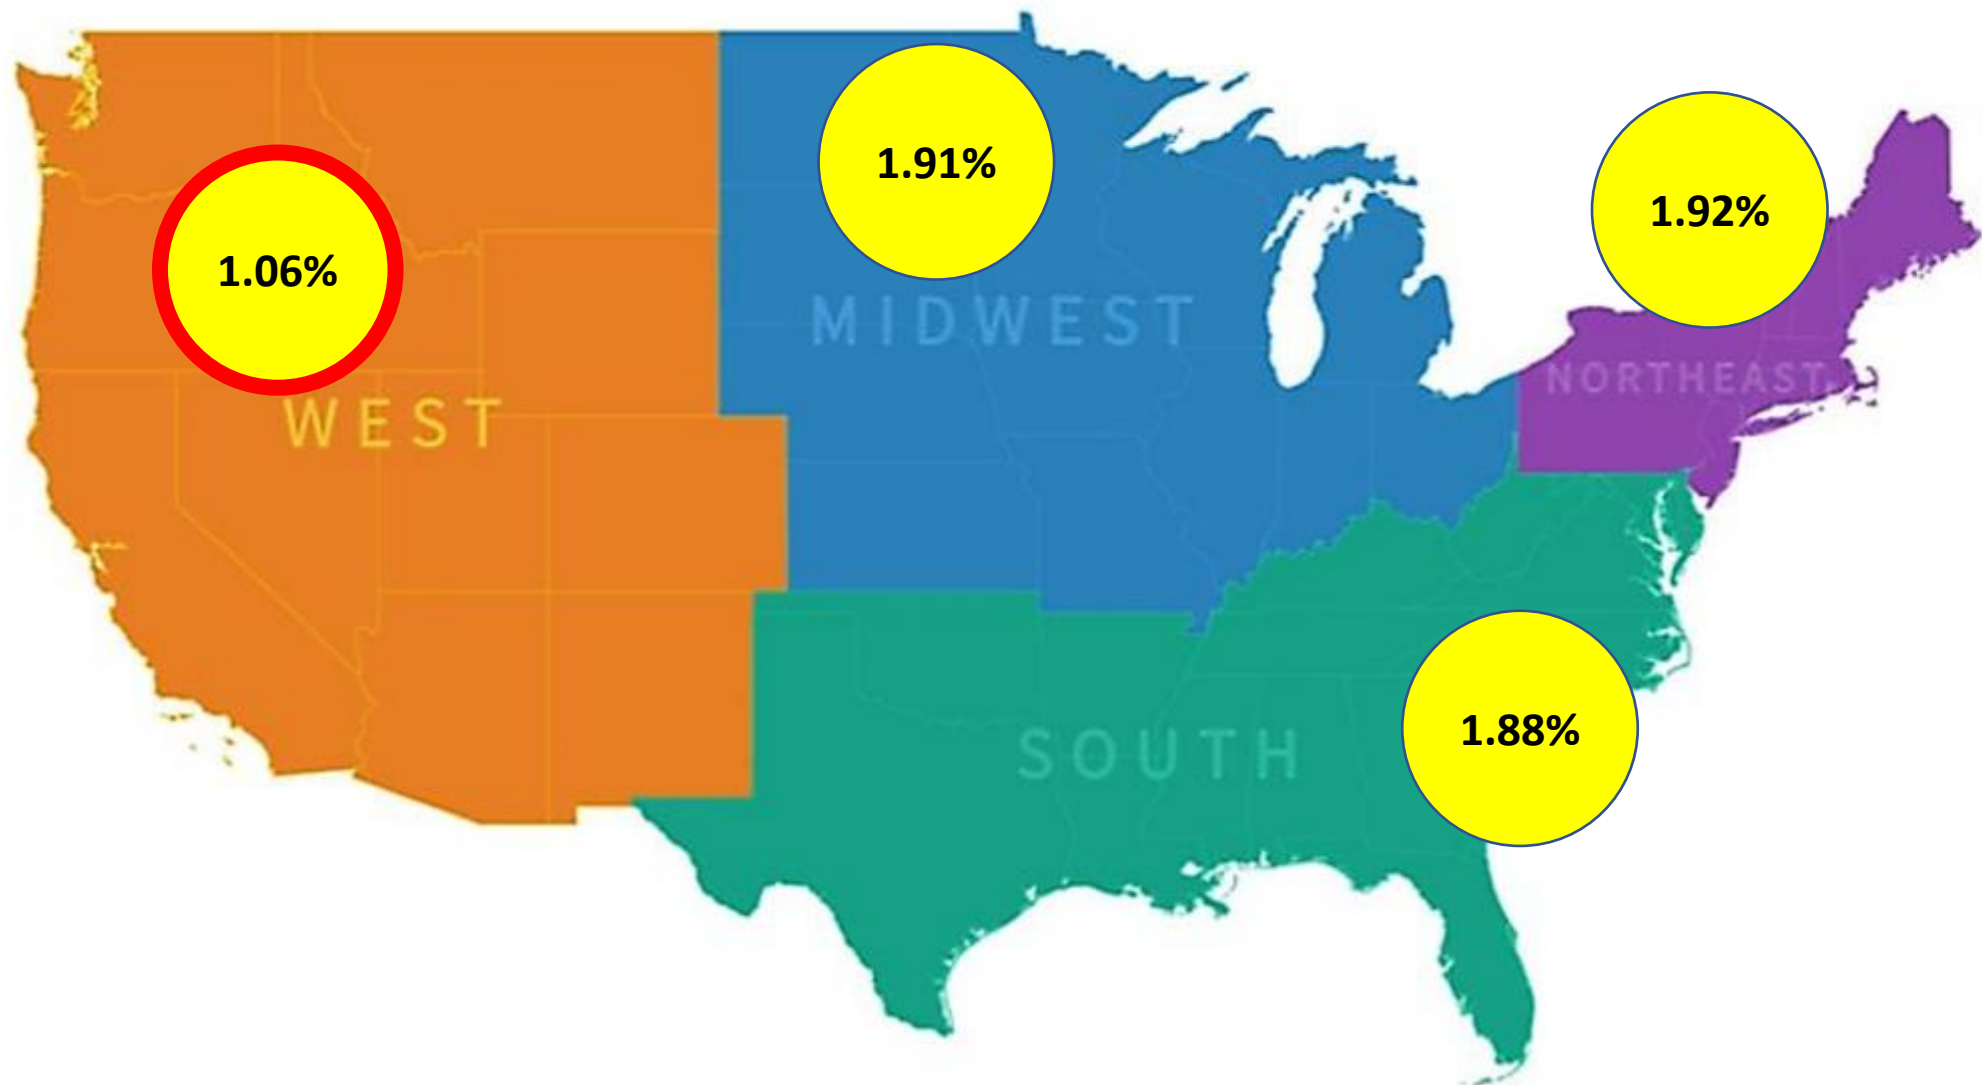

Percent willingness to increase rental price for one unit increase in efficiency

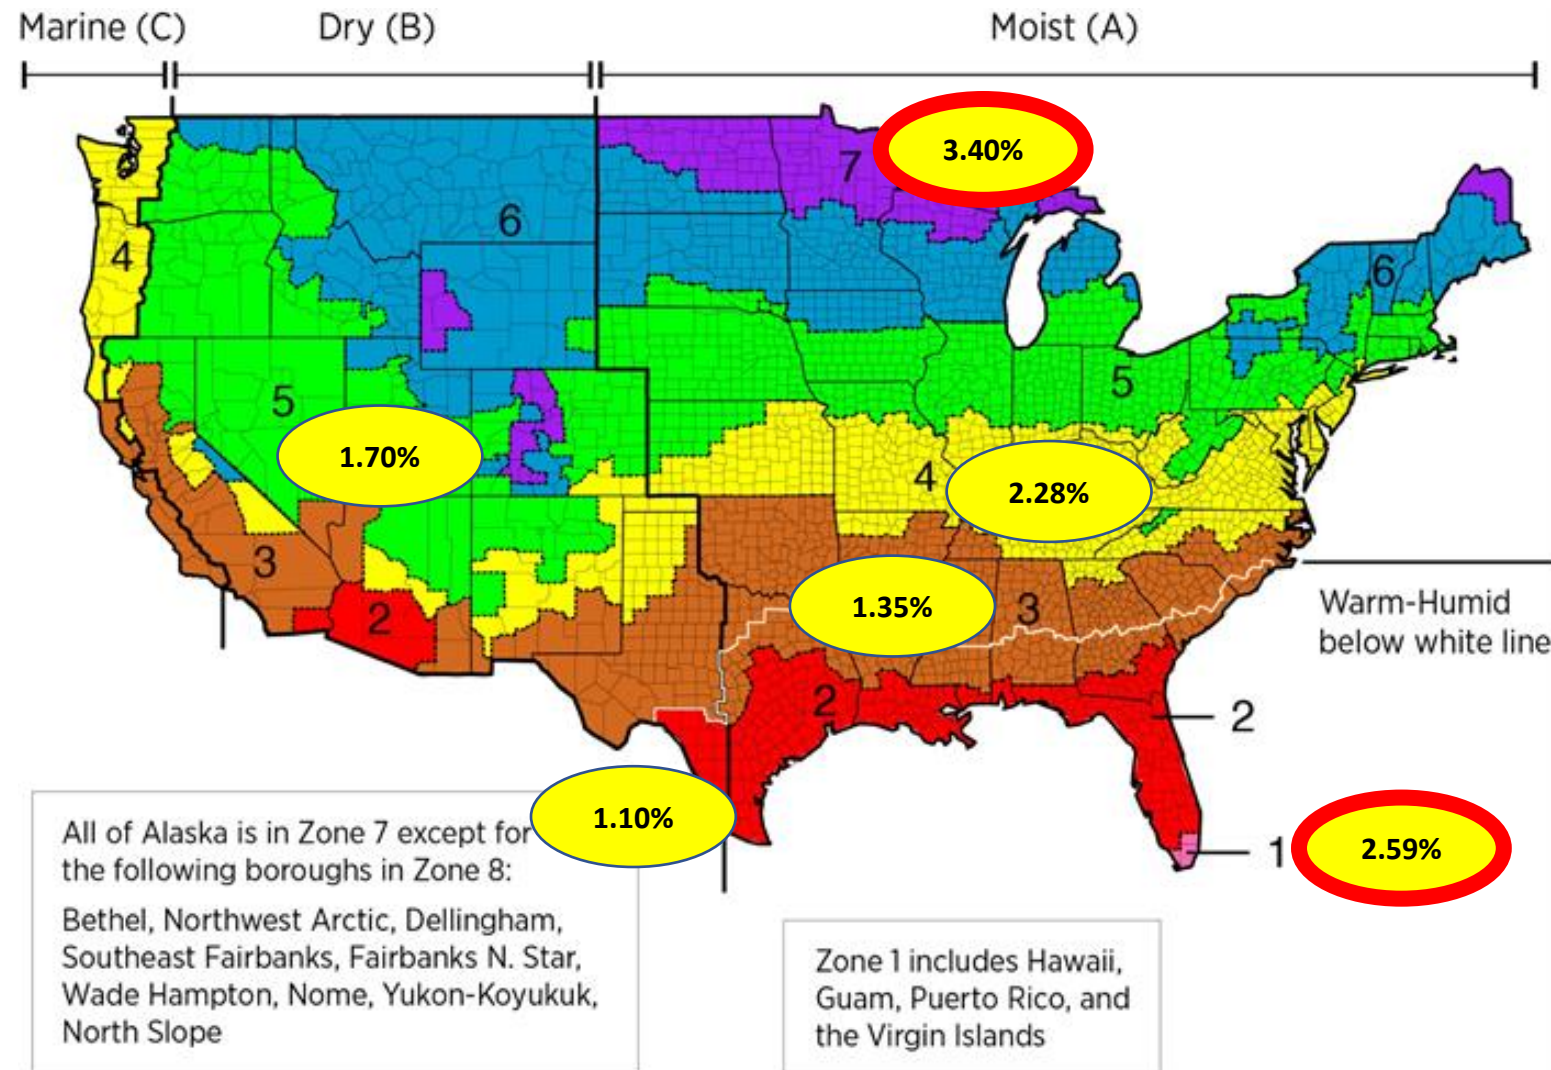

Which Renters Value Energy Efficiency the Most?

Renters in West Willing to Pay Least

Renters in Hottest and Coolest Climates Willing to Pay Most

Apartment Renters

	House	Apartment
Monthly rent	\$1,354	\$1,221
WTP for 3 units [SD]	\$65.99 [5.12]	\$69.75 [4.0]
WTP for 1 unit	\$22.00	\$23.25
WTP as a percentage of rent	1.62%	1.90%
Annual revenue increase for 3-unit improvement	\$791.88	\$837.00

Intended Rental Price

Key Takeaways

Energy efficiency information = clicking more efficient rentals

Voluntary labeling (only most efficient) was less effective

High-context labels are best

Apartment renters, lower-priced rentals willing to pay higher percentage rent increase for efficiency

Renters in milder climates may pay less than hot or cold climates

Policy Recommendations

- Require disclosure of energy-use information at time of listing
- Use a multipolicy approach
- Move toward context-rich labels and away from voluntary labels, if possible
- Use an intuitive rating system

Health + Home Performance Infographic

Do You Have a “Healthy Home?”

A qualified contractor can help you assess and address indoor air quality, improve your comfort, and cut your utility bills.

Answers to a few basic questions can help you get started:

- **How old are your heating and cooling systems?**
Ensuring your system is updated and well maintained can save money and improve health and comfort.
- **Is your home insulated?**
Properly installed insulation in your walls and attic, at levels recommended for your home's climate, will cut bills, and improve comfort.
- **Have you ever noticed mold in your home?**
Visible mold likely means humidity levels need to be better addressed or indicates a potential leak or water damage.
- **Are your windows caulked and doors weather-stripped?**
These relatively simple fixes reduce air leaks and help maintain indoor temperature levels.
- **Are your appliances ENERGY STAR® rated?**
ENERGY STAR appliances are energy efficient and help you save money.
- **Do you know if your home's heating and cooling systems include proper levels of ventilation?**
Effective ventilation is important for both health and safety. Ventilation, along with frequently replaced air filters, can help make sure your home is bringing in fresh air as needed, and keep out pollutants when outdoor air quality is poor due to ozone, fire, or other factors.

DOE/EE-2349

HOME PERFORMANCE WITH ENERGY STAR

DOE’s new Health + Home Performance Infographic reveals the link between efficiency and health – something everyone cares about. Efficiency programs and contractors can use the question-and-answer format to discover a homeowner’s needs.

The infographic is ideal for the “kitchen table” conversations where people decide what to do – and who they want to do it. It also has links for homeowners to find a qualified contractor if they do not already have one.
